

Truss Jib

Truss Jibs - A truss jib is actually utilized to carry and place trusses. It is an extended jib attachment which is equipped together with a pyramid or triangular shaped frame. Usually, truss jibs are mounted on machinery such as a skid steer loader, a compact telehandler or even a forklift using a quick-coupler accessory.

Older style cranes which have deep triangular truss jibs are normally assemble and fastened using bolts and rivets into standard open structural shapes. There are rarely any welds on these kind jibs. Each bolted or riveted joint is prone to rusting and thus needs regular upkeep and check up.

Truss jibs are made with a back-to-back collection of lacing members separated by the width of the flange thickness of an additional structural member. This design can cause narrow separation between the flat exteriors of the lacings. There is limited access and little room to clean and preserve them against rusting. Numerous rivets become loose and rust in their bores and should be changed.
